

Getting Girls Into STEM by Improving Education for Everyone

Asia Anna Eaton, Florida International University

Although women make up about half of the U.S. workforce, they have long been underrepresented in many STEM fields (science, technology, engineering, and math). Given that boys and girls perform similarly in STEM, this means a lot of STEM talent is being left untapped. Until we are successful at including diverse women and girls in STEM, we will be unable to address STEM labor shortages or stay globally competitive in research and development.
